

Liv Mexico Backend Structure

Tech Stack:

1. **Database:** MongoDB
2. **Backend:** Node.js
3. **Authentication:** Google Firebase Auth
4. **Storage:** Google Firebase Storage (*only if MongoDB storage is insufficient*)

Note:

The backend architecture must be secure, modular, and optimized for scalability. Include appropriate authentication, authorization, and validation layers. Ensure proper use of middleware for logging, error handling, and security checks (e.g., rate limiting, input sanitization).

Features and Requirements

Two Admin Panels

There will be two distinct admin panels with separate access controls and roles:

1. Our Admin Panel

Required Modules:

1. **Dashboard:**
 - Display total number of visitors
 - Total number of applications (with subdivision: processed vs pending)
 - Total number of admin members
2. **User Management:**
 - Manage registered users and their roles
 - Enable/disable user access
3. **Applications:**
 - All functionalities similar to Raizing Global
 - Additional features:
 - Allow re-uploading of documents

- Remark input box
- Send email option using predefined email templates

4. **User Profile Management:**

- Ability to update client application status: *Pending, Approved, Rejected, Reupload*
- Status changes should be reflected via API responses for frontend integration

5. **Settings:**

- Modify core configurations of the admin panel (e.g., access levels, notification settings, email templates)

2. **Embassy Admin Panel**

Required Modules:

1. **Dashboard:**

- Show total applications received, payment details, application statuses (as in Raizing Global)
- Number of processed applications
- Number of logged-in agents

2. **Applicant Profile Management:**

- Embassy should be able to update client application status: *Pending, Approved, Rejected, Reupload*
- Status updates should sync with our system through API integration

3. **Notification Panel:**

- Enable communication between our team and the embassy
- Notifications or remarks should be stored and retrievable via APIs

4. **Applications Page:**

- Display all applications with document preview access
- Include a remark input box — remarks should trigger notifications on our dashboard and be sent via email to both our team and the client
